

MARKET UPDATE **SERIES**

Two-Piece Collars are Easy to Install!

Climax Premium 2-piece clamp collars offer the ease of installation with the advantage of little disassembly requirements.

These collars also offer bore flexibility in addition to the ID tolerance.

The saw cut or curf removes from 1/16" to 1/8" depending on bore size and will allow the collar to tighten on somewhat undersized shafting.

The collars are used to position and lock to shaft cams, conveyor rolls, gears, pulleys, sheaves, sprockets and a multitude of other machine components where exact adjustment is not required to transmit thrust and torque loads.

In addition, these collars are great adjustable limiters or shaft spacers. They are an easy way to create a shoulder, eliminating the need to machine expensive splines, keyways and shoulders on shafts, rods and spindles.

Contact Climax for more information on our complete line of Shaft Collars & Rigid Couplings.

As always, we appreciate your Business!
