MARKET UPDATE

SERIES

Problem:

A customer needs a method to hold a drum pulley, a sprocket or a sheave securely on a shaft. There is not a standard part available and all alternatives such as keyed, splined, press fit, QD and Taper Lock bushings have not been effective. We need to offer the customer an opportunity to eliminate the need to have a keyway cut into the shafting and allow him to use a standard shaft saving him time, money and downtime. Ringfeder, Bikon, and B-Loc may not have the specific dimension shaft hub connecting device.

Solution:

A custom quality Climax Keyless Locking Assembly!

Our Keyless Locking Assemblies can be custom ordered up to 35" or 900mm ID. With a modest lead-time of 4-12 weeks. We can offer a prompt and reasonable quote for your customers "special" needs.

Please contact our knowledgeable and friendly customer service team to help you be the solution to your customer's problems.

We currently stock 3/4-8" and 19 to 500mm ID, but anything over 500mm to 900mm can be custom ordered!
